

## fix crysis 2 black screen while closing the application

A: I don't know whether you had a problem with your laptop's GPU or it's your graphics card fault. This is how to fix black screen with the first method: Get rid of the compatible Intel Graphics Technology driver and install another one (you can get it from the help of your laptop, as you have no AMD graphics card). Get rid of the Nvidia GeForce driver and install the following: Nvidia GeForce 310.32.16 WHQL/304.73.07 Beta or 310.20.18 WHQL/304.62.02 Beta (however do not install the Beta versions because they have instability issues) Install the game with the Nvidia GeForce Settings. My laptop manufacturer didn't provide me with a fix for this problem in their latest driver releases, but the game still works with an older (non-beta) graphics driver and I recommend you to follow the same method. You can't use NastiX Afterburner to fix this problem. It will only solve this for laptops with integrated graphics card. And this is not your fault but manufacturer's fault, since NastiX works only on integrated graphics cards. You can get the compatible Intel Graphics Technology driver and an AMD Radeon graphics card (however, do not install the Beta versions of your driver). Use the Windows built-in driver instead of the AMD or AMD's proprietary drivers. I am trying to connect to my Cassandra Datastore via spark I am trying to build a query to get some data from the cassandra table. I get an error when I try to pass my query to my DataFrame 'SparkContext' object is not callable code: df = spark.read.format("cassandra").options(table="datastore").load("some\_query") df.

On regular computers it is recommended that you install Crysis 3 in a simulated environment to prevent an unexpected crash from occurring. The reason for this is that Crysis 3 or CryEngine 3 needs certain files to run in a simulated environment, these files are known as patches. If the patches of Crysis 3 are not installed, it is possible that you will experience a crash in game even if you have performed the correct steps. Take for example you have 5.1 graphics and are following the instructions in step 2 to play the game in a simulated environment. After copying the content of the extracted directory over to the simulated . Your computer might not have enough memory, graphics card, or a clean install. This can be overcome by using one of the two ways listed below. These instructions are for the PC. If you were attempting to use the Mac version, instructions are available below. Step 2: Find an external hard drive This is a portable external hard drive which will be used to make a virtual image from your computer. When you have found a drive which you can use, create an image of your computer using your preferred program. This image file will be used later to create a simulated environment which will be used to play Crysis 3. Step 3: Install CryEngine 3 Take the image file of your computer and install it in a virtual machine called VMWare Workstation. Step 4: Adjust video settings Now that you have installed the CryEngine 3, you will need to adjust video settings to match your video card. Follow the steps below: Select the CryEngine 3 folder from the drop-down list of your virtual machine. Open the CryEngine 3 folder. Open the CryApp folder and open the cryapp.ini file Under the [Video] section, put 'x1' for first person, and 'x2' for third person. You can repeat these steps for other resolutions if needed. Step 5: Compile the patches In the CryEngine 3 folder, open the cryapp folder and open the cryapp.exe file. After opening the application, the game should be loaded and the patches should have been compiled. If this step is skipped you are risking a crash in the game. Step 6: Play Crysis 3 Play 82138339de
